

LAND RELATED INFORMATION SYSTEM

Client: County of Oxford

Malone Given Parsons Ltd. provided assistance with the County of Oxford Land Related Information System. The County of Oxford Land Related Information System (LRIS) accesses and links data from six unique provincial government data bases through a Geographic Information System. By integrating information from a number of government data bases, the System makes useful and relevant information that otherwise would be largely inaccessible and inapplicable.

This integrated data is made accessible through menu-driven, task-oriented subsystems that allow users of varying degrees of computer expertise to display, retrieve, update and add information according to specific functions. The System is shared among the County, eight local municipalities and several Boards and Commissions. We worked together with a number of provincial ministries and federal bodies to design, implement and maintain the System. Shared access and the integration of a number of government data bases are the two key features that make the County of Oxford LRIS unique among land related information systems.
