

POLICE DISPATCH SYSTEM

Client: City of London

Malone Given Parsons Ltd. assisted the City of London and the London Police Department with the implementation of an automated police dispatch system. Our role in the project was to convert an existing single line street network system developed for education purposes, into a graphic and tabular database for implementation within the proposed police dispatch system.

The objectives of the project were to develop an accurate database that could be readily maintained by existing City procedures. The project focused on developing interchanges between a variety of graphic and tabular systems, as well as developing timely and accurate maintenance procedures.

The project addressed interesting issues regarding municipal addresses, identification of vacant lands and well-known buildings. The project provided a sound demonstration to the City of London of the practical applications in emergency dispatch for single line street networks.
